

**Save a couple
of trees with...**

InsulStar®

**Environmental
High Density Insulation**

The lumber savings for an average new home is 2.8 trees when insulating with InsulStar® Environmental High Density Insulation.

If you're building in Climate Zone 10 or colder (blue area in map) and insulating with glass fiber batts, you'll need to install 2x6 studs in your exterior walls to achieve the required R-values.

With InsulStar's high R-values and insulation efficiency, required R-values can be installed in 2x4 studwall cavities. The reduced lumber requirement means fewer trees harvested.
